CASE STUDY
# University of Dayton and Multiple Thermostat Manager

The University of Dayton implemented Sensi Multiple Thermostat Manager (MTM) in March of 2019 to help monitor, control and save energy across campus. MTM is a low-cost, plug-n-play lightweight building management system that gives facility managers the ability to adjust hundreds of thermostats remotely with the click of a button.

Before implementing MTM, the university had basic, non-programmable thermostats where students had free range of the HVAC system and the ability to set temperatures outside of allowable thresholds at extreme temps, causing major issues. Each summer, University of Dayton's HVAC techs would have to travel across campus to each of the hundreds of thermostats to adjust the temperatures manually. This was impractical and used a lot of labor for little gain.

"The time savings have been huge. Our technicians can actually pull it up on their phones, iPad, laptop, whatever they work from, and view it after they make the repair to identify that the unit is still working without ever having to go back to that location."

Josh Massey, HVAC Manager for the University of Dayton

MTM has provided invaluable remote access and insight into each HVAC unit before technicians make an on-site visit.

Saving time. Saving energy. Saving money—all with Sensi Multiple Thermostat Manager. Once a Sensi thermostat is installed and connected to Wi-Fi, it only takes a few minutes to set up and connect to MTM on the cloud. It's that easy. See what Sensi can do for your school today!
